Recent Academic Projects

- **Identifying gun violence victims with Pointer Networks (on-going)**: This project identifies the victims and event details of gun violence incidents in the United States from news corpus using pointer neural nets.
- **Quantifying Semantic Similarity of Sentences using Long Short-Term Memory Networks**: Designed and implemented a sequence-to-sequence model (LSTM network) for classifying semantically similar and dissimilar questions from Quora, carrying an accuracy of 83% on validation after tuning.
- **Domain Specific Classification using AlexNet**: Tuned the layers of a pre-trained AlexNet model for binary classification task on images that obtained an accuracy 94% for the new task.
- **The Fake News Stance Classification**: Achieved an accuracy of 88% on classifying fake news from the genuine ones to four discrete levels - agree, discuss, disagree, and unrelated using handcrafted linguistic features along with distance features from vectorized fields(Word2Vec). Random Forests, Support Vector Machines, and XGBoost algorithms were used for performance comparison.
- **Home Value Prediction**: Modeled Zillow's house rent prediction problem using Microsoft's LightGBM algorithm with a mean absolute error of 0.064.
